## INTRODUCTION

Cotton performance trials were conducted during 2012 at Lubbock, Halfway, and Pecos, Texas A&M AgriLife Research Stations. The Tulia variety test was planted on the Dale Swinburn farm, and the Lamesa variety tests were planted on the AG-CARES research farm.

The Lubbock tests were planted in either Amarillo or Olton soils, the Halfway test in Pullman clay loam soils, AG-CARES in Amarillo fine sandy loam, and Pecos tests in Hoban silty clay loam soils.

The 2012 cotton growing season started off on a promising note with decent planting moisture and warm temperatures. This allowed producers to get most of the 4.2 million acres planted up to a decent stand even under dryland production systems. However, the promising note soon turned sour with well below normal rainfall amounts across most of the region. Although the drought was lessened somewhat from 2011, it still attributed significantly to the 45% abandonment of cotton acres in the Texas High Plains and Panhandle regions. There were however, some “bright” spots where significant rainfall was received and producers were fortunate and harvested some dryland production fields. As the season progressed, some beneficial rains assisted irrigation but more was needed to optimize yields in most locations. In terms of heat unit accumulations, the area was approximately 20% above normal for the first half of the season and the trend continued into the second half until an early freeze event on 8-October abruptly halted further accumulations. However, even with the early freeze, most producers were able to harvest cotton that resulted in better than expected fiber quality. Micronaire averaged 3.89 and 4.08 from the Lubbock and Lamesa classing offices, respectively. Also, from the Lubbock classing office, length averaged 35.2, strength averaged 30.1 g/tex, and an average uniformity of 79.9% was observed. Averages for length, strength, and uniformity from Lamesa were 35.2, 30.1 g/tex, and 79.9%, respectively. Color grades were mostly 21 and leaf grades were mostly 2 and 3 from both locations. In all, a total of 2.89 million bales were classed from districts 1N and 1S.

Disease and insect pressures were mixed across the region. Early on, average to above average seedling disease moderate thrips pressure, depending on location, were observed in the High Plains. Incidence of *Verticillium wilt* and *Fusarium wilt* approached near normal levels in 2012, and some *Alternaria blight* was observed in fields where soil salinity levels were elevated due to continued drought conditions. Plant bugs and bollworm pressures were practically non-existent and other cotton insect pest numbers were considered light (cotton aphid) to very light (spider mites). Finally, rootknot nematode levels were slightly higher than was observed in 2011, but still below normal levels for the area. Variety selections for resistance to specific disease pathogens and root-knot nematodes, as well as Bollgard II and Widestrike technologies, help keep yield losses in check for these pests.

## ACKNOWLEDGMENTS

Fiber properties were measured at the Fiber and Biopolymer Research Institute, Texas Tech University, with financial support from Texas Department of Agriculture.

Plains Cotton Improvement Program contributed additional financial support to the variety testing effort. The Plains Cotton Improvement Committee is important to the independent variety testing service and to the variety testing strategy of the Texas A&M AgriLife Research breeding program in Lubbock as the High Plains continues to be relied upon as a consistent supplier of high quality cotton.

Planting, seed and field preparation, plot maintenance, harvest, sample ginning, and data collection were performed by: Joel Arce, Troy Arce, Mark Arnold, Garrett Besler, David Brockman, Landon Brown, Natalia Castillo, Cole Clark, Trey Cutts, Jacob Duncan, Heather Flippin, Johnny Fuentes, Madeline Giroir, Mitchell Gregory, Morgan Hector, Brad Harris, Carol Kelly, Cherie Lollis, Jimmy Mabry, Nick Macha, Juliana Osorio-Marin, Hunter Parrott, Joshua Pickrell, Bradley Selby, Monica Sheehan, Wesli Kay Stubbs, Raymond Tillis, Dylan Wann, Leslie Wells, and Reuben Zamora. Bacterial blight, *Verticillium wilt*, and nematode ratings were performed Dr. Terry Wheeler, with the assistance of Landon Kitten and Victor Mendoza. The assistance of all of these people is gratefully acknowledged and appreciated.

## GLOSSARY OF TABLE HEADINGS

### Yield and Turnout

Yield - Pounds of lint harvested per acre.

#### Gin Turnout

Lint - Percentage of lint of the stripper-harvested cotton.

Seed - Percentage of seed of the stripper-harvested cotton.

### Agronomic Properties - Determined from hand-snapped samples.

#### Percent Lint

Picked - Lint fraction of seed cotton.

Pulled - Lint fraction of burr cotton.

Boll Size - Weight, in grams, of seed cotton per boll.

Seed Index - Weight, in grams, of 100 fuzzy seed.

Lint Index - Weight, in grams, of lint from 100 seed (calculated).

Seed Per Boll - Average number of seed per boll (calculated).

### Visual Properties

Maturity - Visual assessment of openness on a given date.

Storm Resistance - Visual rating from 1 (very loose boll type, considerable seed cotton loss) to 9 (very tight boll type, no seed cotton loss).

Height – Measured average plant height, in inches, of a given variety.

### Statistical Analysis

Mean - The average value for the trait being observed.

c.v.,% - Coefficient of variation. A relative measure of variation within a test, defined as the sample standard deviation expressed as a percentage of the sample mean.

LSD - Least significant difference. If the difference between two means exceeds this value, the two means are significantly different at the 0.05 probability level.

### Fiber Properties - Measured by High Volume Instrument (HVI)

Micronaire - A relative measure of fiber linear density (mass per unit length) determined by air permeability.

Length - An instrument measure of fiber length, expressed in hundredths of a inch, which approximates the classer's staple length.

Uniformity - A measure of the uniformity of fiber length in a sample, measured as the ratio of mean length to upper half mean length, expressed as a percentage.

Strength - The force required to rupture (or break) a fiber sample, expressed in grams per tex.

Elongation - The amount that a fiber sample will stretch prior to breakage. This is a measure of the deformation of fiber at rupture expressed as percent change in length based on the original fiber length.

Leaf Index- The visual estimate of the amount of cotton plant leaf material that remains in the lint after the ginning process, ranging from 1 to 7.

Rd - Degree of reflectance. This measures how light or dark the fiber sample is, expressed as a percentage. Lower Rd values indicate a grayer sample.

+b - Yellowness. This measures the degree of color pigmentation. Higher +b values indicate yellower samples.

Color Grade - A function of the Rd and +b of the fiber sample. The color grade indicates the quadrant of the Nickerson-Hunter cotton colorimeter diagram in which Rd and +b values intersect.

*<sup>1/</sup>Fiber quality determinations are made on samples from two reps. If the color grade from these two samples are identical, only one color grade is reported. Color was not reported for all tests in 2011.*

\*Patterson, R.E. 1950. A method of adjustment for calculating comparable yields in variety tests.

Table 10. Production information for dryland performance test at Texas A&M AgriLife Research, Lubbock, TX 2012

Test:	Uniform Variety
Planting Date:	May 2
Row Spacing:	40in
Planting Pattern:	Solid
Herbicide:	Medal @ 1pt/A applied July 13
Fertilizer:	100-20-0 lbs/A applied pre-plant
Rainfall:	10.37 inches during season
Harvest Aids:	none
Harvest Date:	October 26
Freeze Date:	October 8

Table 19. Production information for furrow irrigated performance test at Texas A&M AgriLife Research, Pecos, TX 2012

Test:	Regional Cotton Variety
Planting Date:	May 7
Row Spacing:	34-42in variable (equivalent to 38in)
Planting Pattern:	Solid
Herbicide:	Prowl @ 2pt/A applied pre-plant
Fertilizer:	None
Irrigations:	Furrow irrigations approximately every 2 weeks in season
Rainfall:	May-October = 6.54 inches
Harvest Aids:	Gramoxone @ 1pt/A
Harvest Date:	November 9

\* Patterson, R.E. A method of adjustment for calculating comparable yields in variety tests.

Table 22. Production information for the irrigated performance test at Texas A&M AgriLife Research, Lubbock, TX 2012

Test:	Late Planted Variety
Planting Date:	June 11
Row Spacing:	40in
Planting Pattern:	Solid
Herbicide:	Trifluralin @ 1.5pt/A applied pre-plant Caparol @ 1.2qt/A applied May 8 Medal @ 1pt/A applied July 13
Fertilizer:	100-20-0 lbs/A applied pre-plant
Irrigations:	4.5 acre inches pre-plant 2.7 acre inches July 1 2.9 acre inches July 19 2.4 acre inches July 31 <u>1.5 acre inches August 15</u> 14.0 acre inches total
Harvest Aids:	Boll'd @ 32oz/A and Def 6 @ 12oz/A applied October 10
Freeze Date:	October 8
Harvest Date:	November 27
